To Whom It May Concern,

During the construction of a 117 foot sport fisher, stains occurred on the overhead weather deck.

After the installation, marine moisture and dust mixed with other grime caused stains to occur on over two-thirds of the panels. These stains were left until the vessel was launched and we started cleaning and prepping the boat. The stains had become so bad it required the overheads to be completely washed. At the time we started the cleaning process, we noticed that no matter what we used, it was not getting the stains off. The manufacturer was contacted to see if they had any suggestions on how to remove the brown stains. Some recommendations were made, but nothing brought the panels back to their original brilliant white. The manufacturer had never seen a problem like this before.

We tried MEK, Acetone, Softscrub, Ajax, 409, Fantastic, Oil Eater, and a number of citrus cleaners. Then I came across the product called BIOTUFF from Green Mountain. This product not only removed the brown stains, but also turned the boards back to the original brilliant white they were when first purchased.

We have also used the product in the engine room, the bilge and on all the hydraulic equipment as prep before painting. No matter what the job, the product performs exceptionally well. If we had not located this outstanding product, all overhead boards on both decks would have had to have been replaced at a significant cost.

I would highly recommend this product to anyone, and want to thank the people at Green Mountain for their products and enormous help in solving this dilemma.

Sincerely,
Thomas C. Duncan
